MetaIERG MEDICAL OXYGEN REGULATORS AND REDUCERS are compact, easy to operate, reliable and robust. Medical oxygen regulators are the basic devices for distributing and reducing oxygen from cylinders in oxygen therapy sets.

The company's devices are equipped with stepwise regulation, thanks to which the person using oxygen therapy is given oxygen with constant flow rate. Oxygen sets are used in hospitals, fire brigade and other emergency services, ambulances, and many others where oxygen should be administered to the person who requires oxygen therapy.

Many years of experience and high awareness of the company in this field have enabled them to achieve high durability and reliability of their reducers.

Nestmedic S.A. is the manufacturer of the innovative telemedicine solution Pregnabit® for remote monitoring of fetal well-being, through cardiotocography (CTG).

Cardiotocography makes it possible to monitor fetal heart rate, mother's pulse, with simultaneous recording of uterine muscle contraction activity and fetal movements. The test is carried out as part of intensive prenatal care and also allows early detection of fetal life-threatening situations.

“Pregnabit System” consists of two compatible components: a mobile device for carrying out the CTG examination and the Pregnabit Cloud platform for remote analysis of CTG records by qualified medical personnel. Thanks to the solution we offer, pregnant women can independently, in the comfort of their own home, perform cardiotocography at any time, which is the basic examination for assessing the condition of the fetus.

UES sp. z o.o. addresses the global issue of early diagnosis of heart defects, which have low detection rates worldwide. The global detection rate of Congenital Heart Defects (CHD) is low (35-50%), with CHD being the second most common cause of neonatal deaths.

UES software is the answer to these problems. It is based on AI using machine learning. Trained medical personnel or a doctor after performing standard projections in a specified manner and analyzing the images USG by UES software receives an answer in the form of confirmation or lack of CHD with a probability of 96%. Such information allows the newborn to be referred for additional tests or a consultation with a specialist. The area of application is considered to be the scope of global neonatology.
